# 1 Introduction

#### 1.1

To minimise

$$E(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} (y(x_n, \mathbf{w}) - t_n)^2,$$
(1.1)

setting its derivative to zero gives

$$\mathbf{0} = \sum_{n=1}^{N} \frac{\partial y(x_n, \mathbf{w})}{\partial \mathbf{w}} \left( y(x_n, \mathbf{w}) - t_n \right). \tag{1.2}$$

Substituting

$$y(x_n, \mathbf{w}) = \sum_{j=0}^{M} w_j x_n^j \tag{1.3}$$

gives

$$0 = \sum_{n=1}^{N} x_n^i \left( \sum_{j=0}^{M} w_j x_n^j - t_n \right).$$
 (1.4)

Therefore,

$$\sum_{i=0}^{M} A_{ij} w_j = T_i \tag{1.5}$$

where

$$A_{ij} = \sum_{n=1}^{N} x_n^{i+j},$$

$$T_i = \sum_{n=1}^{N} x_n^{i} t_n.$$
(1.6)

### 1.2

To minimise

$$\tilde{E}(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} (y(x_n, \mathbf{w}) - t_n)^2 + \frac{\lambda}{2} ||\mathbf{w}||^2,$$
 (1.7)

setting its derivative to zero gives

$$\mathbf{0} = \sum_{n=1}^{N} \frac{\partial y(x_n, \mathbf{w})}{\partial \mathbf{w}} (y(x_n, \mathbf{w}) - t_n) + \lambda \mathbf{w}.$$
 (1.8)

Substituting

$$y(x_n, \mathbf{w}) = \sum_{j=0}^{M} w_j x_n^j \tag{1.9}$$

gives

$$0 = \sum_{n=1}^{N} x_n^i \left( \sum_{j=0}^{M} w_j x_n^j - t_n \right) + \lambda w_i.$$
 (1.10)

Therefore,

$$\sum_{j=0}^{M} \tilde{A}_{ij} w_j = T_i \tag{1.11}$$

where

$$\tilde{A}_{ij} = \sum_{n=1}^{N} x_n^{i+j} + \lambda \delta_{ij},$$

$$T_i = \sum_{n=1}^{N} x_n^i t_n.$$
(1.12)

#### 1.3

Let a, o and l be the events where an apple, orange and lime are selected respectively. The probability that an apple is selected is given by

$$p(a) = p(a|r)p(r) + p(a|b)p(b) + p(a|g)p(g).$$
(1.13)

Substituting  $p(a|r) = \frac{3}{10}$ ,  $p(r) = \frac{1}{5}$ ,  $p(a|g) = \frac{1}{2}$ ,  $p(r) = \frac{1}{5}$ ,  $p(a|g) = \frac{3}{10}$  and  $p(g) = \frac{3}{5}$  gives

$$p(a) = \frac{17}{50}. (1.14)$$

If an orange is selected, the probability that it came from the geen box is given by

$$p(g|o) = \frac{p(g,o)}{p(o)}.$$
 (1.15)

Here,

$$p(g, o) = p(o|g)p(g),$$
  

$$p(o) = p(o|r)p(r) + p(o|b)p(b) + p(o|g)p(g).$$
(1.16)

Substituting  $p(o|r) = \frac{2}{5}$ ,  $p(r) = \frac{1}{5}$ ,  $p(o|b) = \frac{1}{2}$ ,  $p(b) = \frac{1}{5}$ ,  $p(o|g) = \frac{3}{10}$  and  $p(g) = \frac{3}{5}$  gives  $p(g, o) = \frac{9}{50}$  and  $p(o) = \frac{9}{25}$ . Therefore,

$$p(g|o) = \frac{1}{2}. (1.17)$$

#### 1.4

Let

$$x = g(y) \tag{1.18}$$

and  $\hat{x}$  and  $\hat{y}$  be the locations of the maximum of  $p_x(x)$  and  $p_y(y)$  respectively. Let us assume that there exists  $\epsilon > 0$  such that  $g'(y) \neq 0$  for  $|y - \hat{y}| < \epsilon$ . Then, differentiating both sides of the transoformation

$$p_y(y) = p_x(g(y)) |g'(y)|$$
 (1.19)

and substituting  $y = \hat{y}$  gives

$$0 = g'(\hat{y})p'_x(g(\hat{y})) + p_x(g(\hat{y}))g''(\hat{y}).$$
(1.20)

Therefore, in general,

$$\hat{x} \neq g\left(\hat{y}\right). \tag{1.21}$$

Here, let us assume that

$$g(y) = ay + b. (1.22)$$

Then, differentiating both sides of the transformation and substituting  $y = \hat{y}$  gives

$$0 = p_x'\left(g\left(\hat{y}\right)\right). \tag{1.23}$$

$$\hat{x} = g\left(\hat{y}\right). \tag{1.24}$$

By the definition,

$$var f(x) = E(f(x) - Ef(x))^{2}.$$
 (1.25)

The right hand side can be written as

$$E((f(x))^{2} - 2f(x)Ef(x) + (Ef(x))^{2}) = E(f(x))^{2} - (Ef(x))^{2}.$$
 (1.26)

Therefore,

$$\operatorname{var} f(x) = \operatorname{E} (f(x))^{2} - (\operatorname{E} f(x))^{2}.$$
 (1.27)

#### 1.6

By the definition,

$$cov(x,y) = E((x - Ex)(y - Ey)).$$
(1.28)

The right hand side can be written as

$$Exy - E(xEy) - E(yEx) + E(ExEy) = Exy - ExEy.$$
 (1.29)

The right hand side can be written as

$$\int xyp(x,y)dxdy - \int xp(x)dx \int yp(y)dy.$$
 (1.30)

If x and y are independent, by the definition,

$$f(x,y) = f(x)f(y). \tag{1.31}$$

Then,

$$\int xyp(x,y)dxdy = \int p(x)dx \int p(y)dy.$$
 (1.32)

$$cov(x,y) = 0. (1.33)$$

Let

$$I = \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}x^2\right) dx. \tag{1.34}$$

Then

$$I^{2} = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^{2}}\left(x^{2} + y^{2}\right)\right) dx dy. \tag{1.35}$$

By the transformation from Cartesian coordinates (x, y) to polar coordinates  $(r, \theta)$ , the right hand side can be written as

$$\int_0^\infty \int_0^{2\pi} \exp\left(-\frac{1}{2\sigma^2}r^2\right) \begin{vmatrix} \cos\theta & -r\sin\theta \\ \sin\theta & r\cos\theta \end{vmatrix} dr d\theta = 2\pi \int_0^\infty \exp\left(-\frac{1}{2\sigma^2}r^2\right) r dr. \tag{1.36}$$

By the transformation  $s = \frac{r}{\sigma}$ , the right hand side can be written as

$$2\pi\sigma^2 \int_0^\infty \exp\left(-\frac{1}{2}s^2\right) s ds = 2\pi\sigma^2 \left[-\exp\left(-\frac{1}{2}s^2\right)\right]_0^\infty. \tag{1.37}$$

Therefore,

$$I = \left(2\pi\sigma^2\right)^{\frac{1}{2}}.\tag{1.38}$$

By the definition,

$$\mathcal{N}\left(x|\mu,\sigma^2\right) = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right). \tag{1.39}$$

Then

$$\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) dx. \tag{1.40}$$

By the transformation  $t = x - \mu$ , the right hand side can be written as

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}t^2\right) dt = (2\pi\sigma^2)^{-\frac{1}{2}} I.$$
 (1.41)

$$\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx = 1. \tag{1.42}$$

If x is under the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ , then

$$Ex = \int_{-\infty}^{\infty} x \mathcal{N}\left(x|\mu, \sigma^2\right) dx. \tag{1.43}$$

By the definition, the right hand side can be written as

$$\left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} x \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) dx. \tag{1.44}$$

By the transformation  $y = x - \mu$ , it can be written as

$$\left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} (y+\mu) \exp\left(-\frac{1}{2\sigma^2}y^2\right) dy. \tag{1.45}$$

Since

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} y \exp\left(-\frac{1}{2\sigma^2}y^2\right) dy = 0,$$
 (1.46)

and

$$\left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \mu \exp\left(-\frac{1}{2\sigma^2}y^2\right) dy = \mu \int_{-\infty}^{\infty} \mathcal{N}\left(y|\mu,\sigma^2\right) dy, \tag{1.47}$$

we have

$$\mathbf{E}x = \mu. \tag{1.48}$$

By the definition,

$$\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx = 1 \tag{1.49}$$

can be written as

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) dx = 1.$$
 (1.50)

Differentiating both sides with respect to  $\sigma^2$  gives

$$(2\pi)^{-\frac{1}{2}} \left(-\frac{1}{2}\right) (\sigma^2)^{-\frac{3}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2} (x-\mu)^2\right) dx + (2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \frac{1}{2} (\sigma^2)^{-2} (x-\mu)^2 \exp\left(-\frac{1}{2\sigma^2} (x-\mu)^2\right) dx = 0.$$
(1.51)

The left hand side can be written as

$$-\frac{1}{2} (\sigma^{2})^{-1} \int_{-\infty}^{\infty} \mathcal{N}(x|\mu, \sigma^{2}) dx + \frac{1}{2} (\sigma^{2})^{-2} \int_{-\infty}^{\infty} (x - \mu)^{2} \mathcal{N}(x|\mu, \sigma^{2}) dx$$

$$= -\frac{1}{2} (\sigma^{2})^{-1} + \frac{1}{2} (\sigma^{2})^{-2} \text{var}x.$$
(1.52)

Therefore,

$$var x = \sigma^2. (1.53)$$

# 1.9

By the definition,

$$\mathcal{N}\left(x|\mu,\sigma^2\right) = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right). \tag{1.54}$$

Setting its derivative to zero gives

$$0 = (2\pi\sigma^2)^{-\frac{1}{2}} \left( -\frac{1}{\sigma^2} (x - \mu) \right) \exp\left( -\frac{1}{2\sigma^2} (x - \mu)^2 \right). \tag{1.55}$$

Therefore, the mode is given by  $\mu$ .

Similarly, by the definition,

$$\mathcal{N}(\mathbf{x}|\boldsymbol{\mu}, \boldsymbol{\Sigma}) = (2\pi)^{-\frac{D}{2}} |\boldsymbol{\Sigma}|^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})\right). \tag{1.56}$$

Setting its derivative to zero gives

$$\mathbf{0} = -(2\pi)^{-\frac{D}{2}} |\mathbf{\Sigma}|^{-\frac{1}{2}} \left(\mathbf{\Sigma}^{-1} + \left(\mathbf{\Sigma}^{-1}\right)^{\mathsf{T}}\right) (\mathbf{x} - \boldsymbol{\mu}) \exp\left(-\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \mathbf{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})\right).$$
(1.57)

Therefore, the mode is given by  $\mu$ .

#### 1.10

By the definition,

$$E(x+y) = \int \int (x+y)p(x,y)dxdy.$$
 (1.58)

The right hand side can be written as

$$\int x \left( \int p(x,y)dy \right) dx + \int y \left( \int p(x,y)dx \right) dy = \int x p(x)dx + \int y p(y)dy.$$
(1.59)

By the definition, the right hand side can be written as

$$Ex + Ey. (1.60)$$

Therefore,

$$E(x+y) = Ex + Ey. (1.61)$$

Similarly, by the definition,

$$var(x + y) = E(x + y - E(x + y))^{2}$$
 (1.62)

By the result above and the definition, the right hand side can be written as

$$E(x - Ex)^{2} + 2E((x - Ex)(y - Ey)) + E(y - Ey)^{2}$$

$$= varx + 2cov(x, y) + vary.$$
(1.63)

If x and y are independent, then

$$cov(x,y) = 0, (1.64)$$

by 1.6. Therefore,

$$var(x+y) = varx + vary. (1.65)$$

#### 1.11

To maximise

$$\ln p\left(\mathbf{x}|\mu,\sigma^{2}\right) = -\frac{N}{2}\ln\left(2\pi\sigma^{2}\right) - \frac{1}{2\sigma^{2}}\sum_{n=1}^{N}(x_{n}-\mu)^{2},\tag{1.66}$$

setting the partial derivatives with respect to  $\mu$  and  $\sigma^2$  to zero gives

$$0 = \frac{1}{\sigma^2} \sum_{n=1}^{N} (x_n - \mu),$$

$$0 = -\frac{N}{2\sigma^2} + \frac{1}{2(\sigma^2)^2} \sum_{n=1}^{N} (x_n - \mu)^2.$$
(1.67)

Therefore,

$$\mu_{\rm ML} = \frac{1}{N} \sum_{n=1}^{N} x_n,$$

$$\sigma_{\rm ML}^2 = \frac{1}{N} \sum_{n=1}^{N} (x_n - \mu_{\rm ML})^2.$$
(1.68)

#### 1.12

If  $x_m$  and  $x_n$  are independent, then

$$Ex_m x_n = Ex_m Ex_n. (1.69)$$

If they are samples from the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ , the right hand side is given by  $\mu^2$ . On the other hand, by the definition,

$$Ex_n^2 = var x_n + (Ex_n)^2. (1.70)$$

If  $x_n$  is a sample from the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ , the right hand side is given by  $\sigma^2 + \mu^2$ . Therefore,

$$Ex_m x_n = \mu^2 + \delta_{mn} \sigma^2. \tag{1.71}$$

Here, since

$$\mu_{\rm ML} = \frac{1}{N} \sum_{n=1}^{N} x_n, \tag{1.72}$$

we have

$$E\mu_{ML} = \frac{1}{N} \sum_{n=1}^{N} Ex_n.$$
 (1.73)

Therefore,

$$E\mu_{ML} = \mu. \tag{1.74}$$

Similarly, since

$$\sigma_{\rm ML}^2 = \frac{1}{N} \sum_{n=1}^{N} (x_n - \mu_{\rm ML})^2, \qquad (1.75)$$

we have

$$E\sigma_{ML}^2 = \frac{1}{N} \sum_{n=1}^{N} E(x_n - \mu_{ML})^2.$$
 (1.76)

The right hand side can be writen as

$$\frac{1}{N} \sum_{n=1}^{N} E\left(x_n^2 - 2\mu_{\text{ML}}x_n + \mu_{\text{ML}}^2\right) = \frac{1}{N} \sum_{n=1}^{N} Ex_n^2 - \frac{2}{N} E\left(\mu_{\text{ML}}\left(\sum_{n=1}^{N} x_n\right)\right) + E\mu_{\text{ML}}^2.$$
(1.77)

The first term of the right hand side can be written as

$$\frac{1}{N} \sum_{n=1}^{N} (\mu^2 + \sigma^2) = \mu^2 + \sigma^2, \tag{1.78}$$

while the second and third terms can be writen as

$$-2E\mu_{\rm ML}^2 + E\mu_{\rm ML}^2 = -E\mu_{\rm ML}^2. \tag{1.79}$$

Here,

$$E\mu_{\rm ML}^2 = E\left(\frac{1}{N}\sum_{n=1}^N x_n\right)^2.$$
 (1.80)

The right hand side can be written as

$$\frac{1}{N^2} \sum_{n=1}^{N} Ex_n^2 + \frac{2}{N^2} \sum_{1 \le m < n \le N} Ex_m x_n = \frac{1}{N} (\mu^2 + \sigma^2) + \frac{N-1}{N} \mu^2.$$
 (1.81)

Therefore,

$$E\mu_{\rm ML}^2 = \mu^2 + \frac{1}{N}\sigma^2. \tag{1.82}$$

Thus,

$$E\sigma_{\rm ML}^2 = \frac{N-1}{N}\sigma^2. \tag{1.83}$$

#### 1.13

It is clear that

$$E\left(\frac{1}{N}\sum_{n=1}^{N}(x_n-\mu)^2\right) = \frac{1}{N}\sum_{n=1}^{N}E(x_n-\mu)^2.$$
 (1.84)

The right hand side can be writen as

$$\frac{1}{N} \sum_{n=1}^{N} E\left(x_n^2 - 2\mu x_n + \mu^2\right) = \frac{1}{N} \sum_{n=1}^{N} Ex_n^2 - \frac{2\mu}{N} \sum_{n=1}^{N} Ex_n + \mu^2.$$
 (1.85)

The first term of the right hand side can be written as

$$\frac{1}{N} \sum_{n=1}^{N} (\mu^2 + \sigma^2) = \mu^2 + \sigma^2, \tag{1.86}$$

while the second term can be writen as

$$-\frac{2\mu}{N}\sum_{n=1}^{N}\mu = -2\mu^2. \tag{1.87}$$

Therefore,

$$E\left(\frac{1}{N}\sum_{n=1}^{N}(x_{n}-\mu)^{2}\right) = \sigma^{2}.$$
(1.88)

# 1.14

Let

$$w_{ij}^{S} = \frac{1}{2}(w_{ij} + w_{ji}),$$

$$w_{ij}^{A} = \frac{1}{2}(w_{ij} - w_{ji}).$$
(1.89)

Then

$$w_{ij} = w_{ij}^{S} + w_{ij}^{A},$$
  
 $w_{ij}^{S} = w_{ji}^{S},$   
 $w_{ij}^{A} = -w_{ji}^{A}.$  (1.90)

Here,

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{A} x_i x_j = \frac{1}{2} \sum_{i=1}^{D} \sum_{j=1}^{D} (w_{ij} - w_{ji}) x_i x_j.$$
 (1.91)

The right hand side can be written as

$$\frac{1}{2} \left( \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij} x_i x_j - \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ji} x_i x_j \right) = 0.$$
 (1.92)

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{A} x_i x_j = 0. {(1.93)}$$

Additionally,

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij} x_i x_j = \sum_{i=1}^{D} \sum_{j=1}^{D} \left( w_{ij}^{S} + w_{ij}^{A} \right) x_i x_j.$$
 (1.94)

The right hand side can be written as

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{S} x_i x_j + \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{A} x_i x_j = \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{S} x_i x_j,$$
 (1.95)

where the result above is used. Therefore,

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij} x_i x_j = \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{S} x_i x_j.$$
 (1.96)

Finally, since the matrix  $w^{\rm S}_{ij}$  is  $D\times D$  symmetric matrix, its number of independent parameters is  $\frac{D(D+1)}{2}$ .

#### 1.17

By the definition,

$$\Gamma(x) = \int_0^\infty u^{x-1} \exp(-u) du. \tag{1.97}$$

Then

$$\Gamma(x+1) = \int_0^\infty u^x \exp(-u) du. \tag{1.98}$$

The right hand side can be written as

$$[-u^{x} \exp(-u)]_{u=0}^{u=\infty} + \int_{0}^{\infty} x u^{x-1} \exp(-u) du = x\Gamma(x).$$
 (1.99)

Therefore,

$$\Gamma(x+1) = x\Gamma(x). \tag{1.100}$$

By the definition,

$$\Gamma(1) = \int_0^1 \exp(-u)du. \tag{1.101}$$

The right hand side can be written as

$$[-\exp(-u)]_0^\infty = 1. \tag{1.102}$$

Therefore,

$$\Gamma(1) = 0!. \tag{1.103}$$

For a positive integer x, let us assume that

$$\Gamma(x) = (x - 1)!. \tag{1.104}$$

Then,

$$\Gamma(x+1) = x\Gamma(x), \tag{1.105}$$

where the right hand side can be written as

$$x(x-1)! = x!. (1.106)$$

Therefore,

$$\Gamma(x+1) = x!. \tag{1.107}$$

Thus, the assumption is proved by induction on x.

#### 1.18

Let us consider the transformation from Cartesian to polar coordinates

$$\prod_{i=1}^{D} \int_{-\infty}^{\infty} \exp(-x_i^2) dx_i = S_D \int_{0}^{\infty} \exp(-r^2) r^{D-1} dr,$$
 (1.108)

where  $S_D$  is the surface area of a sphere of unit raidus in D dimensions. By 1.7, the left hand side can be written as  $\pi^{\frac{D}{2}}$ . By the transformation  $s = r^2$ , the right hand side can be written as

$$\frac{S_D}{2} \int_0^\infty \exp(-s) s^{\frac{D-1}{2}} s^{-\frac{1}{2}} ds = \frac{S_D}{2} \Gamma\left(\frac{D}{2}\right). \tag{1.109}$$

$$S_D = \frac{2\pi^{\frac{D}{2}}}{\Gamma\left(\frac{D}{2}\right)}. (1.110)$$

Additionally, the volume of the sphere can can be written as

$$V_D = S_D \int_0^1 r^{D-1} dr. (1.111)$$

The right hand side can be written as

$$S_D \left[ \frac{r^D}{D} \right]_{r=0}^{r=1} = \frac{S_D}{D}. \tag{1.112}$$

Therefore,

$$V_D = \frac{S_D}{D}. ag{1.113}$$

Finally, the results above reduce to

$$S_2 = \frac{2\pi}{\Gamma(1)},$$
 (1.114)  
 $V_2 = \frac{S_2}{2}.$ 

Therefore,

$$S_2 = 2\pi,$$
  $V_2 = \pi.$  (1.115)

Similarly,

$$S_{3} = \frac{2\pi^{\frac{3}{2}}}{\Gamma(\frac{3}{2})},$$

$$V_{3} = \frac{S_{3}}{3}.$$
(1.116)

Therefore,

$$S_3 = 4\pi,$$

$$V_3 = \frac{4}{3}\pi.$$
(1.117)

#### 1.19

The volume of a cube of side 2 in D dimensions is  $2^{D}$ . Therefore, the ratio of the volume of the cocentric sphere of radius 1 divided by the volume of the cube is given by

$$\frac{V_D}{2^D} = \frac{\pi^{\frac{D}{2}}}{D2^{D-1}\Gamma(\frac{D}{2})},\tag{1.118}$$

by 1.18.

Additionally, by Stering's formula

$$\Gamma(x+1) \simeq (2\pi)^{\frac{1}{2}} \exp(-x)x^{\frac{x+1}{2}},$$
 (1.119)

the ratio can be approximated as

$$\frac{V_D}{2^D} \simeq \frac{\pi^{\frac{D}{2}}}{D2^{D-1}(2\pi)^{\frac{1}{2}} \exp\left(1 - \frac{D}{2}\right) \left(\frac{D}{2} - 1\right)^{\frac{D}{4}}}.$$
 (1.120)

The right hand side can be written as

$$\frac{1}{2e(2\pi)^{\frac{1}{2}}} \frac{1}{D} \left( \frac{e^2 \pi^2}{8D - 16} \right)^{\frac{D}{4}}.$$
 (1.121)

Therefore, the ratio goes to zero as  $D \to \infty$ .

Finally, the ratio of the distance from the center of the cube to one of the corners divided by the perpendicular distance to one of the sides is given by

$$\frac{\sqrt{\sum_{i=1}^{D} 1^2}}{1} = \sqrt{D}.\tag{1.122}$$

Therefore, the ration goes to  $\infty$  as  $D \to \infty$ .

#### 1.20

Integrating both sides of a Gaussian distributino in D dimensions

$$p(\mathbf{x}) = (2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{\|\mathbf{x}\|^2}{2\sigma^2}\right)$$
 (1.123)

from  $\|\mathbf{x}\| = r$  to  $\|\mathbf{x}\| = r + \epsilon$  gives

$$\int_{r < \|\mathbf{x}\| \le r + \epsilon} p(\mathbf{x}) d\mathbf{x} = \int_{r}^{r + \epsilon} \int (2\pi\sigma^{2})^{-\frac{D}{2}} \exp\left(-\frac{r'^{2}}{2\sigma^{2}}\right) J dr' d\phi, \qquad (1.124)$$

where  $\phi$  is the vector of the angular components of the polar coordinate and J is the Jacobian of the transformation from the Cartesian to polar coordinate.

For a sufficiently small  $\epsilon$ , the right hand side can be approximated as

$$(2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{r^2}{2\sigma^2}\right) \int_r^{r+\epsilon} \int J dr' d\phi$$

$$= (2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{r^2}{2\sigma^2}\right) \int_{r<\|\mathbf{x}\|< r+\epsilon} d\mathbf{x}.$$
(1.125)

Therefore,

$$\int_{r \le ||\mathbf{x}|| \le r + \epsilon} p(\mathbf{x}) d\mathbf{x} \simeq p(r) \epsilon, \qquad (1.126)$$

where

$$p(r) = (2\pi\sigma^2)^{-\frac{D}{2}} S_D r^{D-1} \exp\left(-\frac{r^2}{2\sigma^2}\right),$$
 (1.127)

and  $S_D$  is the surface area of a unit sphere in D dimensions.

Secondly, to maximise p(r), setting the derivative to zero gives

$$0 = (2\pi\sigma^2)^{-\frac{D}{2}} S_D \left( (D-1)r^{D-2} - \frac{r^D}{\sigma^2} \right) \exp\left( -\frac{r^2}{2\sigma^2} \right). \tag{1.128}$$

Therefore, p(r) is maximised at a sigle stationary point

$$\hat{r} = \sqrt{D - 1}\sigma. \tag{1.129}$$

Thirdly, by the expression of p(r) above,

$$\frac{p\left(\hat{r}+\epsilon\right)}{p\left(\hat{r}\right)} = \left(\frac{\hat{r}+\epsilon}{\hat{r}}\right)^{D-1} \exp\left(-\frac{2\hat{r}\epsilon+\epsilon^2}{2\sigma^2}\right). \tag{1.130}$$

Using the expression of  $\hat{r}$  above, the right hand side can be written as

$$\exp\left((D-1)\ln\left(1+\frac{\epsilon}{\hat{r}}\right) - \frac{2\hat{r}\epsilon + \epsilon^2}{2\sigma^2}\right)$$

$$= \exp\left(\frac{\hat{r}^2}{\sigma^2}\ln\left(1+\frac{\epsilon}{\hat{r}}\right) - \frac{2\hat{r}\epsilon + \epsilon^2}{2\sigma^2}\right). \tag{1.131}$$

By the Taylor series

$$\ln(1+x) = x - \frac{1}{2}x^2 + o(x^3), \qquad (1.132)$$

the right hand side can be approximated as

$$\exp\left(\frac{\hat{r}^2}{\sigma^2}\left(\frac{\epsilon}{\hat{r}} - \frac{\epsilon^2}{2\hat{r}^2}\right) - \frac{2\hat{r}\epsilon + \epsilon^2}{2\sigma^2}\right) = \exp\left(-\frac{\epsilon^2}{\sigma^2}\right). \tag{1.133}$$

Therefore,

$$p(\hat{r} + \epsilon) \simeq p(\hat{r}) \exp\left(-\frac{\epsilon^2}{\sigma^2}\right).$$
 (1.134)

Finally, let a vector of length  $\hat{r}$  be  $\hat{\mathbf{r}}$ . Then, by the definition of  $p(\mathbf{x})$ ,

$$\frac{p(\mathbf{0})}{p(\hat{\mathbf{r}})} = \exp\left(\frac{\hat{r}^2}{2\sigma^2}\right). \tag{1.135}$$

Substituting the expression of  $\hat{r}$  above, the right hand side can be written as  $\exp\left(\frac{D-1}{2}\right)$ . Therefore,

$$\frac{p(\mathbf{0})}{p(\hat{\mathbf{r}})} = \exp\left(\frac{D-1}{2}\right). \tag{1.136}$$

#### 1.21

If  $0 \le a \le b$ , then

$$0 \le a(b-a). \tag{1.137}$$

Therefore,

$$a < (ab)^{\frac{1}{2}}. (1.138)$$

For a two-class classification problem of  $\mathbf{x}$ , let the classes be  $\mathcal{C}_1$  and  $\mathcal{C}_2$  and let the decision regions be  $\mathcal{R}_1$  and  $\mathcal{R}_2$ . Let us choose the decision regions to minimise the probability of misclassification. Then,

$$p(\mathbf{x}, \mathcal{C}_1) > p(\mathbf{x}, \mathcal{C}_2) \Rightarrow \mathbf{x} \in \mathcal{C}_1,$$
 (1.139)

and

$$p(\mathbf{x}, \mathcal{C}_2) > p(\mathbf{x}, \mathcal{C}_1) \Rightarrow \mathbf{x} \in \mathcal{C}_2.$$
 (1.140)

Then, using the inequality above,

$$\int_{\mathcal{R}_1} p(\mathbf{x}, \mathcal{C}_2) d\mathbf{x} \le \int_{\mathcal{R}_1} \left( p(\mathbf{x}, \mathcal{C}_1) p(\mathbf{x}, \mathcal{C}_2) \right)^{\frac{1}{2}} d\mathbf{x}, \tag{1.141}$$

and

$$\int_{\mathcal{R}_2} p(\mathbf{x}, \mathcal{C}_1) d\mathbf{x} \le \int_{\mathcal{R}_2} \left( p(\mathbf{x}, \mathcal{C}_1) p(\mathbf{x}, \mathcal{C}_2) \right)^{\frac{1}{2}} d\mathbf{x}. \tag{1.142}$$

$$\int_{\mathcal{R}_1} p(\mathbf{x}, \mathcal{C}_2) d\mathbf{x} + \int_{\mathcal{R}_2} p(\mathbf{x}, \mathcal{C}_1) d\mathbf{x} \le \int \left( p(\mathbf{x}, \mathcal{C}_1) p(\mathbf{x}, \mathcal{C}_2) \right)^{\frac{1}{2}} d\mathbf{x}.$$
 (1.143)

The average loss is given by

$$EL = \sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} L_{kj} p(\mathbf{x}, \mathcal{C}_{k}) d\mathbf{x}.$$
 (1.144)

If

$$L_{ki} = 1 - \delta_{ki}, \tag{1.145}$$

then the right hand side can be written as

$$\sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} \left( p(\mathbf{x}, \mathcal{C}_{k}) - p(\mathbf{x}, \mathcal{C}_{j}) \right) d\mathbf{x} = \sum_{j} \int_{\mathcal{R}_{j}} \left( \sum_{k} p(\mathbf{x}, \mathcal{C}_{k}) - p(\mathbf{x}, \mathcal{C}_{j}) \right) d\mathbf{x}.$$
(1.146)

The right hand side can be written as

$$\sum_{j} \int_{\mathcal{R}_{j}} (p(\mathbf{x}) - p(\mathbf{x}, \mathcal{C}_{j})) d\mathbf{x} = 1 - \sum_{j} \int_{\mathcal{R}_{j}} p(\mathbf{x}, \mathcal{C}_{j}) d\mathbf{x}.$$
 (1.147)

Therefore,

$$EL = 1 - \sum_{j} \int_{\mathcal{R}_{j}} p(\mathcal{C}_{j}|\mathbf{x}) p(\mathbf{x}) d\mathbf{x}.$$
 (1.148)

Thus, minimising the average loss reduces to choosing the criterion to maximise the posterior probatility  $p(C_i|\mathbf{x})$ .

#### 1.23

The average loss is given by

$$EL = \sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} L_{kj} p(\mathbf{x}, \mathcal{C}_{k}) d\mathbf{x}.$$
 (1.149)

The right hand side can be written as

$$\sum_{j} \int_{\mathcal{R}_{j}} \sum_{k} L_{kj} p(\mathbf{x}, \mathcal{C}_{k}) d\mathbf{x} = \sum_{j} \int_{\mathcal{R}_{j}} \left( \sum_{k} L_{kj} p(\mathcal{C}_{k} | \mathbf{x}) \right) p(\mathbf{x}) d\mathbf{x}.$$
 (1.150)

Therefore,

$$EL = \sum_{j} \int_{\mathcal{R}_{j}} \left( \sum_{k} L_{kj} p(\mathcal{C}_{k} | \mathbf{x}) \right) p(\mathbf{x}) d\mathbf{x}.$$
 (1.151)

Thus, mimising the average loss reduces to choosing to minimise  $\sum_k L_{kj} p(\mathcal{C}_k | \mathbf{x})$ .
